MICA 2.0 | implemented activity controls and unmeasured power
WFI -> SLEEP
no new instruction/data requests
clock and enabled counters continue
One aligned-word reuse buffer
fewer instruction transactions
invalidate on stores/redirects/fence.i
Static parameter guards
MUL / BITOPS / TRAP / PERF
unused paths removed by synthesis
activity change only
memory traffic only
mapped resource cost
No implemented power-rail domains
no clock gating or DVFS
watts/joules require physical measurement
